SEPTEMBER 1 INVENTORY

Inventory of hogs and pigs on September 1, 1979 in the 14 States conducting quarterly hog surveys was estimated at 57.0 million head, up 16 percent from a year ago, according to the Crop Reporting Board. This is the largest September 1 inventory since 1970.

- Breeding inventory at 8.24 million head, was up 10 percent from 1978, and up 15 percent from 1977.
- Market hog inventory totaled 48.8 million head, 17 percent above last year and 16 percent more than 1977.

The 14 Quarterly States account for about 86 percent of the U.S. hog and pig inventory.

PIG CROP (JUNE-AUGUST 1979)

The June-August 1979 pig crop in the 14 States totaled 22.3 million head, 16 percent higher than 1978 and 19 percent above 1977. A total of 3.11 million sows farrowed in these States, up 17 percent from last year.

Pigs saved averaged 7.16 for the quarter compared with 7.22 pigs per litter for both 1978 and 1977.

FARROWING INTENTIONS

Producers in the 14 States intend to farrow 3.16 million sows during the September-November 1979 period, 13 percent more than 1978 and 23 percent above 1977.

Farrowing intentions reported for the December 1979-February 1980 period are 2.93 million sows, 10 percent more than a year earlier and 28 percent more than two years ago.

^{1/} BREEDING TOTAL IS DIFFERENCE BETWEEN MARKET HOGS AND TOTAL HOGS.

RELIABILITY AND ESTIMATING PROCEDURES: Primary data used in setting these hog estimates were obtained from probability surveys. Information was collected by mail, telephone and personal interviews. Since all operations with hogs were not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about 2 percent at the 14 Quarterly State level for hog inventory. This means that chances are approximately 95 out of 100 that survey estimates will be within 4 percent of the complete coverage value if the same procedures were used to survey all producers. Survey estimates are also subject to non-sampling errors such as omissions, duplications, and mistakes in reporting, recording and processing the data. These errors cannot be measured directly, but they are minimized through rigid quality controls in the data collection process and a careful review of all reported data for consistency and reasonableness.

The sampling variability of survey estimates on intended farrowings is slightly larger than that for inventories. More important, actual farrowings may differ significantly from reported intentions due to unexpected economic and environmental conditions. These differences have exceeded 4 percent for about one-third of the quarterly pig crops during the last five years.

In setting the inventory estimates, the Crop Reporting Board constructed a U.S. balance sheet using estimates on births, deaths, and check data on slaughter, imports and exports. This balance sheet provided an additional check on survey inventory estimates.
